Ballyclare, Co. Antrim

PROFESSIONAL SUMMARY

Self-motivated software engineer with a BSc in Computer Science from Queen's University Belfast, and a track record of driving full-stack development and codebase modernisation. Proven experience autonomously managing shared component libraries for high-profile platforms, leading full, strict TypeScript migrations, modernising test suites to Playwright CT, and implementing locale-driven website architectures. Combining independent project ownership with agile collaboration to deliver robust, production-ready solutions.

PROFESSIONAL EXPERIENCE

Software Engineer (T) | Feb 2026 - Present

Kainos, Belfast

- Completed an 8-week, AI-first, full-stack engineering academy, working in an agile team to design and build a three-tier application using TypeScript, Express, Prisma, and Bootstrap.
- Established GitHub Actions CI pipelines with automated testing, code quality checks, and Pa11y accessibility validation to automate and improve the development lifecycle.
- Served as the primary developer managing the shared component library and frontend repositories for [AICON Belfast](#), [AICON Canada](#), and [BelTech](#), implementing a locale-driven architecture supporting dynamic regional configurations.
- Led a comprehensive refactor across three major codebases, migrating legacy JavaScript to strict-mode TypeScript to improve type safety, code reliability, and developer experience.
- Overhauled the end-to-end testing infrastructure by replacing basic Jest & Puppeteer setups with full Playwright Component Testing and automated smoke testing suites across all repositories.
- Partnered directly with external client stakeholders to manage agile feature backlogs, execute site updates for major events, and drive independent discovery for bug fixes and UI performance optimisations.

Intern Software Engineer | Jun 2023 - Jun 2024

Liberty IT, Belfast

- Developed and documented a frontend component library using TypeScript & Angular, producing 30+ reusable UI components to standardise front-end delivery and reduce development duplicated work.
- Refactored and extended the automated Jasmine test suite, adding 100+ unit tests and raising coverage by ~35%, improving release confidence while following a test-driven approach.
- Architected and deployed serverless Product Definition microservices using AWS Lambda, ensuring a fault-tolerant, low-latency distributed system for component hosting.
- Configured and optimised CI/CD pipelines in Atlassian Bamboo, reducing build times by 30%.
- Participated in Agile ceremonies, such as daily stand-ups, sprint planning and PI summaries, presenting to Product Owners and stakeholders to align delivery with business objectives.
- Performed code reviews and implemented refactoring tasks to improve maintainability and adherence to engineering standards.
- Implemented application performance monitoring with Datadog APM to speed up incident diagnosis and feed performance data into engineering improvements.

EDUCATION

BSc in Computer Science (2:1) | Sep 2021 - Jul 2025

Queen's University Belfast

- **Final Year Project:** Built a Python application to crawl and analyse financial news using BeautifulSoup, Pandas and Alpha Vantage; researched optimal keyword strategies and integrated time-series data visualisations.
- **Web Technologies:** Created interactive and responsive web applications in a five-person Agile team.
- **Software Testing:** Designed comprehensive black-box and white-box unit test plans and suites for an existing system, ensuring full integration testing.
- **Software Engineering & Systems Development:** Collaborated in an Agile team of 5 to manage sprints and build a Java-based sustainability simulation; shortlisted as Team Finalists for Engineers Without Borders 2023.
- **Artificial Intelligence & Machine Learning:** Developed an image-classification model in R for automated image recognition and categorisation.
- **Cloud Computing:** Implemented and deployed six microservices in different languages on a Kubernetes cluster, integrating them with a provided web front end.
- **Database Systems:** Designed database schemas using MySQL to query large-scale existing systems, and build new systems with provided datasets.

PROJECTS

Personal Website

<https://www.nickparke.co.uk>

- Built with React, JavaScript, HTML and CSS, managed via NPM.
- Multi-page personal portfolio website featuring a landing page, web and downloadable CVs, a Contact page connected to an EmailJS inbox, and links to LinkedIn and GitHub profiles.
- Focused on responsive web design with distinct mobile-only behaviour and custom desktop styling, and showcasing performance focus through content caching in Cloudflare.

Telemetrix Sim, Mathematical Telemetry Model

<https://github.com/nick-p-34/telemetrix-sim>

- Built with Python and requests, managed via pip.
- Mathematical simulation of a race car, using vehicle parameters to simulate realistic telemetry at 20Hz, emitting the results for ingestion by Telemetrix.
- Focused on real-world accuracy, using official regulations for vehicle parameters, deriving performance mathematically, and demonstrating cross-compatibility via Telemetrix integration.

AWARDS & ACHIEVEMENTS

Engineers Without Borders

Team Finalist, 2023

- Selected among top student teams nationwide to develop a sustainable engineering solution, presenting our Java-based e-bike network simulation concept at the UK finals.

Duke of Edinburgh's Award

Silver Award, 2019

- Volunteered at Blythswood Ireland, learned Italian, maintained fitness through regular swimming, and completed a 3-day expedition, demonstrating commitment, teamwork and leadership.

Boys' Brigade Queen's Badge

Youth Leadership, 2019

- Achieved the highest youth leadership award, leading team activities and organising community service projects, becoming a Non-Commissioned Officer in the largest company in the Battalion.
